

Dear Hashicorp,

I have a degree from the University of Cambridge in Law and History of Art and five years of experience as a frontend and full-stack web developer. Before going freelance, (Recent work: <https://hobbes.work>, <https://means.tv>, <https://psilabs.org>), I worked as an early employee for Steem (steemit.com), building user-facing apps and backend microservices, with React, Typescript, and NodeJS as the platform scaled to 1M+ users.

I was a lead developer on steemit.com until its acquisition in May 2020 (<https://github.com/steemit/condenser/graphs/contributors> -- as @gl2748). I worked extensively on both the secure cryptocurrency wallet (steemitwallet.com) and account creation app with extensive authentication features (signup.steemit.com), all as part of a remote, globally distributed open-source team.

More recently, I have been learning Rust, using it to make a static site generator (<https://github.com/imaitland/blog>), while also working on writing a distributed key-value store and working on an email subscription service. I am excited by any opportunity to use Rust's powerful features in production, particularly when it can complement my experience with Typescript, Javascript, and React.
